ITERATION

PROCESS TO FIND SOLUTIONS OF EQUATIONS THOSE CANNOT BE SOLVED OTHERWISE.

$$\chi^3 - e^{3x} + \tan x = 5$$

- 9 The equation $x^3 2x 2 = 0$ has one real root.
 - (i) Show by calculation that this root lies between x = 1 and x = 2.
 - (ii) Prove that, if a sequence of values given by the iterative formula

$$x_{n+1} = \frac{2x_n^3 + 2}{3x_n^2 - 2}$$

converges, then it converges to this root.

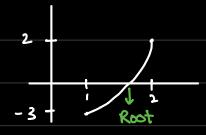

(iii) Use this iterative formula to calculate the root correct to 2 decimal places. Give the result of each iteration to 4 decimal places. [3]

(i) Bring everything to one side and replace "Zero" with y.

$$x^3 - 2x - 2 = 0$$

$$2x-2=4$$

$$y = x^3 - 2x - 2$$

[2]

[2]

x=1 x=1

$$y = (1)^3 - 2(1) - 2$$

 $y = (2)^3 - 2(2) - 2$
 $y = -3$
 $y = 2$

If the sign of y changes, that means root lies between $x=1 \le x=2$.

$$x_{n+1} = \frac{2x_n^3 + 2}{3x_n^2 - 2}$$

converges, then it converges to this root.

[2]

$$x = 2x^{3}+2$$

$$3x^{2}-2$$

$$3x^{3}-2x = 2x^{3}+2$$

$$3x^{3}-2x^{3}-2x-2 = 0$$

$$x^{3}-2x-2 = 0$$
 (Shown)

$$x_{n+1} = \frac{2x_n^3 + 2}{3x_n^2 - 2}$$

(iii) Use this iterative formula to calculate the root correct to 2 decimal places. Give the result of each iteration to 4 decimal places. [3]

x, = average of values	Calculator: (Radions)
